

AI Search & Chat: Research about coolest demos for google ai studio

User: Research about coolest demos for google ai studio

Gemini: Google AI Studio has evolved far beyond a basic developer sandbox. With the integration of **"Build Mode"** (facilitating "vibe coding" through natural language prompting) and real-time multimodal capabilities, it has become a hotbed for rapid, interactive app prototyping.

Google provides an official **App Gallery** (also called **Starter Apps**) right inside AI Studio, showcasing what Gemini, Nano Banana, Veo, and other multimodal models can do.

1. The Coolest Official "Starter Apps" (App Gallery)

These official, open-sourced web templates serve as "springboards" to highlight specific developer capabilities. You can launch, tweak, and remix them with a single click:

- * **Gemini 95:** A highly nostalgic, retro operating system themed after Windows 95, but packed with AI-powered interactions. It showcases how Gemini can play along with complex roleplay and UI constraints.
- * **Video to Learning App:** Input a YouTube URL, and Gemini will watch the video, analyze its contents, and instantly generate an interactive, customized learning app or quiz tailored to that video.
- * **p5js Playground:** Ideal for creatives. You tell Gemini what kind of interactive art or mini-game you want (e.g., "draw a 3D gravity-shifting space galaxy"), and it instantly codes, executes, and previews the interactive `p5.js` canvas on your screen.
- * **Gemini Co-Drawing:** Upload a rough sketch or hand-drawn doodle, and Gemini works alongside you to complete, color, refine, and polished the artwork in real-time.
- * **Dictation App:** Leverages native audio-processing capabilities. You record or upload messy, unstructured voice notes, and Gemini transforms them into clean, beautifully organized, and formatted text documents.
- * **Maps Planner & Map Explorer:** Demonstrates how Gemini uses function calling to interact with Google Maps. You can type in an itinerary request, and Gemini will instantly build, plot, and visually map out your entire trip on an interactive, live-embedded map.
- * **Spatial Understanding:** Upload a photo or video, and watch Gemini detect objects in real-time, instantly

drawing 2D or 3D bounding boxes around them?perfect for developers prototyping robotics, inventory tracking, or AR concepts.

- * **Mumble Jumble & ChatterBots:** Utilizing low-latency Live APIs, these templates let you build and banter with custom, responsive voice-AI characters that react instantly to your voice.

2. Impressive Community & User-Created Demos

Using the **Build Mode** in AI Studio, users and content creators have shown how easy it is to spin up fully functional applications from scratch:

- * **AI B-Roll Generator:** Developers have combined Gemini's reasoning with the **Veo 3.1** and **Nano Banana** APIs. By feeding the app a script, the AI automatically drafts storyboard scenes and outputs generated high-quality B-roll footage.

- * **Multiplayer Web Games:** Utilizing the full-stack server runtimes in AI Studio, users have prompted the tool to build real-time multiplayer games where player cursors are synced on-screen.

- * **Full School/Admin Portals:** In impressive "vibe-coding" case studies, users have built multi-portal websites (e.g., student, teacher, and admin portals) equipped with live streaming, messaging, and database backends in just 48 hours.

How to Explore and Remix Them

1. Go to [Google AI Studio](<https://aistudio.google.com/>).
2. Navigate to the **Build** section or look for the **App Gallery / Showcase**.
3. Select any app that interests you and click **Copy App** or **Remix**.
4. You can instantly preview the code generated by the AI, make modifications using natural language prompts, and even hit **Share** to publish your prototype with a public URL.
